Advanced Research Design and Data Analysis takes a thorough look at the logic of research design, measurement, and inference in the context of behavioural research. Although we will deal extensively with statistics, we will do so from the perspective of the researcher rather than that of the statistician. Features and goals of the course include the use of a popular statistical computer package, known as the R project for statistical computing freely-available for virtually any modern operating system, and discussion of some current controversies. Topics covered will range from a thorough examination of the logic and principles of analysis-of-variance (ANOVA), through multiple regression (MR) to multi-way frequency analysis and randomization testing, to such esoterica as Principal Components Analysis (PCA), signal detection theory, and information theory.

There are two books for the course. One is a useful, short paperback by Edwards on multivariate methods, unfortunately no longer in print, that his estate has given me permission to provide for you at no cost. A pdf of the book is available on the class Moodle site. At times you will be asked to read certain pages and sections, but primarily it will be up to you to use the book as a supplement to lectures and the assigned readings for the course. The other is fun book on R entitled “YaRrr! The Pirate’s Guide to R” by Phillips that can be downloaded at no cost. It is an unfinished work in progress that changes almost weekly, so be sure to check frequently for updates.

Structure of the course

The course breaks roughly into two components. The first component is concerned with the basics of research design and analysis within the context of ANOVA, multiple regression, and multi-way frequency analyses, and is handled primarily with lectures and computer assignments. The second component, running concurrently with the first, is intended to be in more of a seminar format, and is based on the collection of readings on various issues.

Consequently, beyond the core material, the course is intended to be open-ended, ranging from brief flirtations here to in-depth analyses there as determined only by our curiosity and interests. As such, the lectures will range from the coldly objective to the wildly polemical, inflammatory, and even outrageous as the professor (or the author of some article) takes a stand on some issue.

You are encouraged (indeed, required) in all instances to advance your own polemic in the interests of fair play and, more important, in an attempt to understand if not resolve some of the current controversies in the area. Informed and cogent argument rather than agreement with the biases of the professor and/or author is one of the major goals of the course. To this end, you will be required to write “position papers” in in the form of *weekly blogs published to the course Moodle site* in which you are asked to argue for one side or another of a given controversy; which side you favour is up to your reading of the issue, but fence-sitting, compromising, waffling, or any other form of pseudo-intellectual “objectivity” is explicitly disallowed. You are also encouraged to comment intelligently on the blog posts of your fellow students.

It is assumed that the student is familiar with basic, undergraduate statistics, APA format, and so on. If not, or you wish to “brush-up”, please consult my book co-authored with Dr. Allen *Thinking with Data*; the latest edition of which is always available free online, and also may be purchased at cost from the university bookstore.

Evaluation

Almost every week of the course will have one or more assignments consisting of short “position papers”, or computer-based analyses, weighted equally. These will be submitted as blog posts to the blog module on the course Moodle page.

All assignments (i.e., your blog posts) are to be word processed in R Studio Markdown (or \LaTeX and Sweave), which will provide the tools to ensure that the submissions conform to the format specified by the American Psychological Association, especially with respect to referencing, and the ability to integrate \texttt{R} code and output directly in the text of your
blog posts. A large component of the course, and the reason for the weekly papers, is that, through almost weekly feedback, we can learn to produce the clear, concise, expository prose expected by scientific journals. The readings for the course (or links to them, or instructions on how to obtain them) will be available on the course Moodle web-site.

The work you submit must be your own. It is an academic offence to submit someone else’s work as your own. Please see section 4 of Academic Offences, Student Discipline Policy—a academic offences of the university calendar for details.

Class Times

Classes are scheduled from January 10, 2017 to April 6, 2017 for 1:40-2:55, Tuesday and Thursday in TH201. Labs are scheduled for 3:05-4:05, Tuesday in AH 177.

Consultation

No formal office hours are scheduled. Rather, I may be contacted in my office, UH D862, or my lab, UH C810. Please feel free to drop in with any questions, comments, or opinions you may have. I would prefer that in the first instance you use e-mail to communicate with me (vokey@uleth.ca) and your fellow classmates (psyc3400a@uleth.ca and psyc5400a@uleth.ca).

On Learning

\textbf{R} is a powerful statistical package and programming system. Mastering it takes time and practise—a lot of practise. The associated application, \textit{R Studio}, is an Integrated Development Environment (IDE) that makes that task much easier, and we will do all of our explorations about \textbf{R} with that application. The weekly tutorials are provided to get you started, but you really must engage with \textbf{R} on an almost daily basis to obtain that mastery and, hence, the power it provides. That means you will have to explore it on your own time, using the internet, the \textbf{R} web-site, the many supplementary resources available there, and not just use it to do the minimum required by the weekly tutorials. To that end, \textit{it is required that each student has ready access to a computer on which the latest version of \textbf{R} and \textit{R Studio}, \textit{\LaTeX} (and other associated packages) can be installed, and accessed frequently. To properly make use of the unique facilities made available to us in Room AH 177 for the labs/tutorials, you will need an HDMI dongle for the video-out port of your computer.}

Table 1: Assignment-exam percentages will be converted to minimum letter-grades using this scale. Minimum letter-grade here refers to the lowest letter-grade that will be assigned on the basis of your objective performance; however, higher letter-grades may be assigned at the discretion of the instructor.
